

Armitage Lab IT359

Objective:

Objective: To learn to use Armitage to find weaknesses in systems and use the results to determine how to penetrate from an ethical standpoint. Analyze the systems, perform enumeration, and remediate any risks.

Preparation

Proxmox:

To use Proxmox, the system which hosts our Virtual Machines, go to <https://pve.login.it.ilstu.edu>, and login in with your ULID and password, and the domain (“realm”) *adilstu*.

You’ll see a screen that looks something like this.

You will NOT need a VPN to use this site from off-campus.

Click on the drop-down menu in the left corner and select “Pool view” as your default view. Click on the project name (e.g., “IT359.01-sjphil3”) to reveal the virtual machines contained in the project.

Select a machine on the left pane by clicking on it. Right click to reveal a VM specific menu that allows you to start/stop/reboot the VM as well as open its console.

Note: If your browser pop-ups are disabled, you may need to allow the pop-up window manually to view the console.

Copy/paste from a VM to your host machine is not possible. To work around this, if needed, I’d recommend using either Google Keep, or Pastebin. Simply log in to the service on both your own machine and each VM where you want to use copy/paste, and paste into a new Keep/Pastebin note, and it will appear on the other side.

Please refer to <https://support.it.illinoisstate.edu/kb/category/proxmox/> to learn other features of Proxmox including taking snapshots (backup of VMs), rolling back snapshots etc.

Armitage Lab IT359

Michael:

Credentials for VMs

Kali: user-root password-toor

Prerequisites Required:

1. **Kali Linux** installed
2. Internet connection
3. Root or sudo privileges.
4. Metasploit installed (usually pre installed in Kali).

Install Armitage:

Step 1: Verify armitage is installed using the following command

```
sudo apt install armitage -y
```

Step 2: Ensure you have metasploit running. This can be verified with this command

```
msfconsole
```

Step 3: Launch Armitage

```
sudo armitage
```

If you get a GUI pop-up ensure the following look like this:

Host: 127.0.0.1

Port: 55553

User: msf

Pass: msf

Leave defaults unless you configured them differently.

Click **"Connect"**.

Armitage Lab IT359

1. Familiarizing yourself with Armitage

Submit a Screenshot Showing you are in Armitage (3pts)

Next, let's set up a machine we want to test with Armitage. Go to the top of the GUI and select Host, then click on "Add Hosts". After this, type the IP Address for which you will be testing Armitage with. Hint: (For this lab we will be inputting the IPs of the Windows 16, Windows 12, Windows 10, and Windows 8 devices).

Submit a Screenshot Showing the Machines Configured on the Right Hand Side (3pts)

2. Cracking Windows Passwords

On the Windows 16 machine click on the IP address 10.10.10.16. After you click the machine go to the left hand corner and select analyze folder in the left column. Once you click the analyze folder, select the crack_windows file to run a username and password cracker.

Submit a Screenshot Showing The Usernames And Passwords Cracked (3pts)

3. Scanner

On your Windows 16 machine click the Scanner folder and locate the Netbios folder in the dropdown. Double click the nbname and run this command.

Submit a Screenshot Showing The Information Cracked (3pts)

```
msf6 auxiliary(scanner/netbios/nbname) > run -j
[*] Auxiliary module running as background job 10.
[*] Sending NetBIOS requests to 10.10.10.16->10.10.10.16 (1 hosts)
[+] 10.10.10.16 [WIN-ESVU38BTHJS] OS:Windows Names:(WORKGROUP, WIN-ESVU38BTHJS) Addresses:(10.10.10.16, 169.254.141.130)
Mac:de:5d:4c:97:65:a5
[*] Scanned 1 of 1 hosts (100% complete)
msf6 auxiliary(scanner/netbios/nbname) >
```
